1. Security Case: To prevent users from modifying sensitive properties such as `IsAdmin` or `Salary`. A ViewModel includes only the properties the user is allowed to submit, helping prevent Overposting attacks.

2. Combining Multiple Models: When a View needs data from multiple models, such as `Employee` and `Department`, we can combine the required data into a single ViewModel.

3. Custom Data for the View: When the View needs properties that do not exist in the Entity Model, such as `ConfirmPassword` or a `DepartmentList` for a dropdown list.
